Chapter 13: I/O Systems

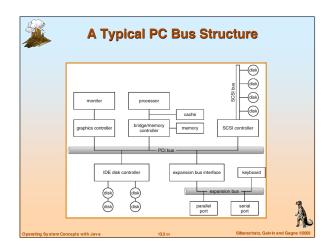

- I/O Hardware
- Application I/O Interface
- Kernel I/O Subsystem
- Transforming I/O Requests to Hardware Operations
- Streams

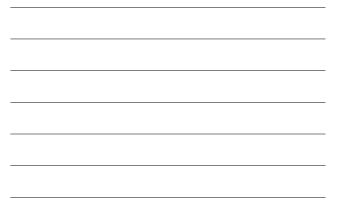

g System Concepts with Jay

Performance

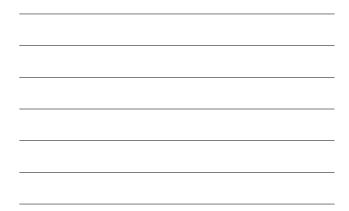

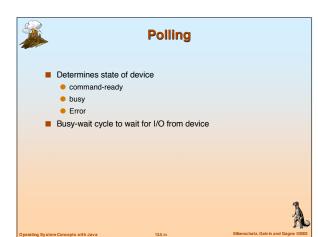

| X | Device I/O Port Loca | ations on PCs (partial) | |
|-------------|----------------------------------|--------------------------------|-----------|
| | I/O address range (hexadecimal) | device | |
| | 000-00F | DMA controller | |
| | 020-021 | interrupt controller | |
| | 040-043 | timer | |
| | 200-20F | game controller | |
| | 2F8-2FF | serial port (secondary) | |
| | 320-32F | hard-disk controller | |
| | 378-37F | parallel port | |
| | 3D0-3DF | graphics controller | |
| | 3F0-3F7 | diskette-drive controller | |
| | 3F8-3FF | serial port (primary) | 9 |

Interrupts

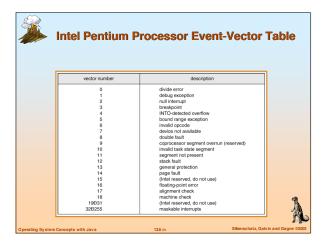

- CPU Interrupt request line triggered by I/O device
- Interrupt handler receives interrupts
- Maskable to ignore or delay some interrupts
- Interrupt vector to dispatch interrupt to correct handler
 Based on priority
 - Some unmaskable

System Concepts with Java

Interrupt mechanism also used for exceptions

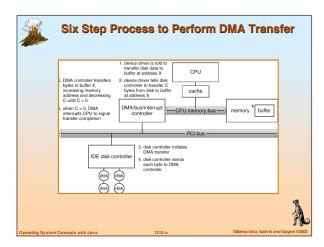

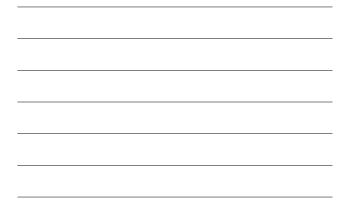

- Used to avoid programmed I/O for large data movement
- Requires DMA controller

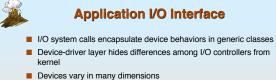

E.

 Bypasses CPU to transfer data directly between I/O device and memory

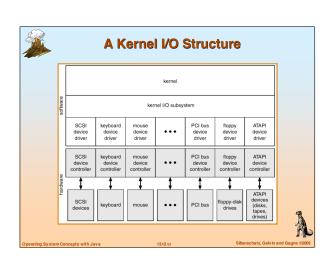

A

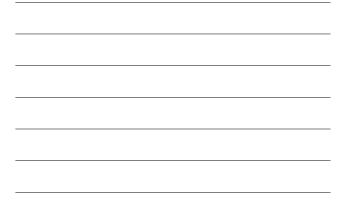

- Character-stream or block
 - Sequential or random-access
 - Sharable or dedicated
 - Speed of operation
 - read-write, read only, or write only

A

| | Characteristics of I/O Device | | |
|--------------------|---|---------------------------------------|--|
| aspect | variation | example | |
| data-transfer mode | character block | terminal disk | |
| access method | sequential random | modem CD-ROM | |
| transfer schedule | synchronous asynchronous | tape keyboard | |
| sharing | dedicated sharable | tape keyboard | |
| device speed | latency seek time transfer rate delay between operations | | |
| I/O direction | read only write only readĐwrite | CD-ROM graphics controlled disk | |

Block and Character Devices

- Block devices include disk drives
 - Commands include read, write, seek
 - Raw I/O or file-system accessMemory-mapped file access possible
- Character devices include keyboards, mice, serial ports
 Commands include get, put
 - Libraries layered on top allow line editing

epts with Ja

Network Devices

TAK

- Varying enough from block and character to have own interface
- Unix and Windows NT/9i/2000 include socket interface
 Separates network protocol from network operation
 - Includes select functionality
- Approaches vary widely (pipes, FIFOs, streams, queues, mailboxes)

 ioctl (on UNIX) covers odd aspects of I/O such as clocks and timers

System Concepts with Jay

Blocking and Nonblocking I/O

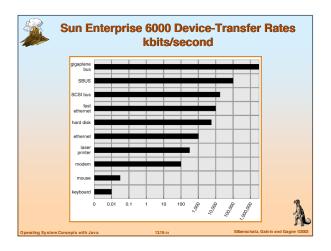

- Blocking process suspended until I/O completed
 Easy to use and understand
 - Insufficient for some needs
- Nonblocking I/O call returns as much as available
 - User interface, data copy (buffered I/O)
 - Implemented via multi-threading
 - Returns quickly with count of bytes read or written
- Asynchronous process runs while I/O executes
 Difficult to use
 - I/O subsystem signals process when I/O completed

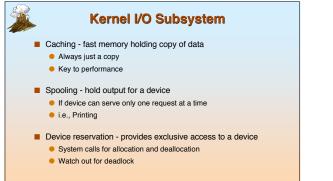

Scheduling

System Concepts with Java

- Some I/O request ordering via per-device queue
- Some OSs try fairness
- Buffering store data in memory while transferring between devices
 - To cope with device speed mismatch
 - To cope with device transfer size mismatch
 - To maintain "copy semantics"

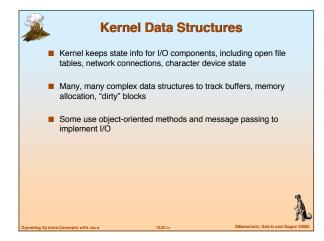

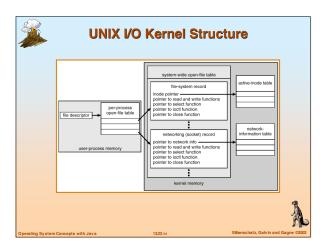

J.K

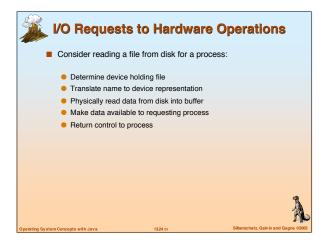

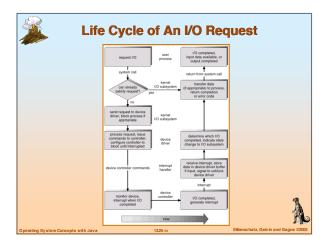

- OS can recover from disk read, device unavailable, transient write failures
- Most return an error number or code when I/O request fails
- System error logs hold problem reports

System Concepts with Jan

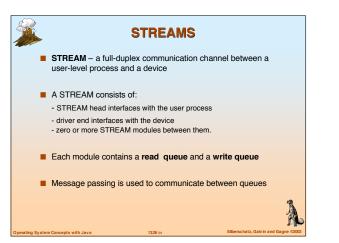

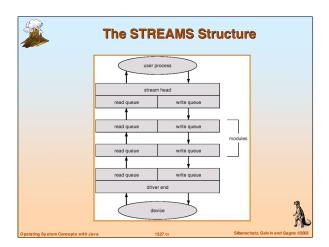

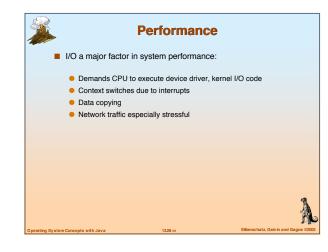

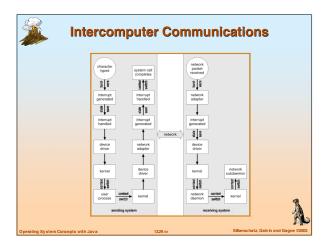

Improving Performance

- Reduce number of context switches
- Reduce data copying
- Reduce interrupts by using large transfers, smart controllers,
- polling
- Use DMA
- Balance CPU, memory, bus, and I/O performance for highest throughput
